

PROJECT CONTINUITY SUMMARY

Dataset

The dataset used for this project is the Superstore dataset, which contains information on orders, customers, products, sales, profit, discounts, regions, and other business-related attributes.

1. Business Problem

The business needs to understand its sales and profitability performance across different products, categories, customer segments, and geographical regions. The analysis aims to identify areas of strong performance, areas of poor performance, and factors that may be affecting profitability.

2. Key Findings From Week 2

The Week 2 analysis provided insights into the following areas:

- * Sales and profit performance varied across product categories and sub-categories.
- * Some products and categories generated strong sales and profitability, while others contributed less to overall performance.
- * Regional performance differed, with some regions recording stronger sales and profit than others.
- * Customer segments showed different levels of contribution to sales and profitability.
- * Sales performance changed over time, revealing useful trends across different periods.
- * High sales did not always translate into high profitability, highlighting the need to examine discounts and profit margins more closely.

3. Areas For Further Investigation In Week 3

Based on the findings from Week 2, the Week 3 analysis will investigate:

- * The factors influencing product and category profitability.
- * Products and sub-categories with consistently low or negative profit.
- * The relationship between discounts, sales, and profit.
- * Regional and geographical differences in profitability.
- * Customer segments that contribute most to overall profit.

- * Sales and profit trends in greater detail.
- * Areas of the business where performance can be improved.
- * Specific products, regions, and customer groups that require deeper investigation.

Conclusion

The Week 2 analysis established a foundation for understanding the overall performance of the Superstore business. The Week 3 analysis will build on these findings by conducting a deeper investigation into profitability, discounts, product performance, customer segments, and regional performance to uncover actionable business insights.
